Subject: Broadband over Power Lines

Ladies and Gentlemen:

Let me go on record as being opposed to the use of broadband over the power lines. If we as amateur radio operators can't use the 136 kHz segment of the LF band because it will interfere with PLC than so be it.

But, for the FCC to turn around and even think of looking into using the power lines for broadband with a frequency spread from 2 MHz up to 80MHz is ludicrous.

I am against this for obvious reason, interference. This will create even more power line interference than usual and we have all heard horror stories about power line noise.

What good for the goose is good for the gander.

Sincerely,

David J. Moge
